ID:	UC-9
Title:	Administrator looks for individual to update their record
Description:	The Administrator would like to find a members record and update the contact information. They would like to search a list of user and select the appropriate user. They would also like see what was entered in the Database and determine if it needs to be updated or simply left as is without reentering the information. This use case will allow the Administrator to search for any registered user and update their information. The classification of Admin is based on permissions assigned at login.
Primary Actor:	Administrator
Preconditions:	Administrator selects a User (or Administrator) from a List to update their record
Postconditions:	The registered Users will be displayed in a list. The Administrator will only be required to update new or changed information associated with a user. The updated record will be saved to the Database and displayed to the administrator.
Main Success Scenario:	Search registered users (and Admin) 1. Admin selects Update member menu. 2. A Search menu will display all available users and ask the Administrator which record to update. 3. The Administrator will choose a member and the associated information will be displayed one field at a time allowing the Administrator the option to update the field or accept the current values an move forward to the next field. 4. The Administrator will have the opportunity to review the data to confirm accuracy before submitting to update the Database. 5. The Database will be updated and the Administrator will be returned to the Administrator Main Menu.
Extensions:	Search Skill 2. Database connection error. Error reported to user. 3. The Administrator improperly selects the wrong Member Record. Escape path is provided to exit the update and choose a different Member record. 4. The Administrator finds inaccurate data in the record to be updated and chooses to correct before submission. 5. Database connection error. Error reported to user.
